

## Measuring your feet

1. Make sure the individual is standing erect, and not in an angle. Please have someone else measure your feet.
2. Your pen/pencil must be strait up and down, and not in an angle when tracing.
3. Measure form the longest toe to the heel in centimeters, add half (1/2) centimeter more, this will give you our Mexican size. (see example below)
4. Then measure the ball of the feet in centimeters.

When faxing or emailing your drawing, please make sure that you write down the measurements, as scanners and faxes tend to shrink the image.

**Hints:** measure both feet, and use the bigger of the two measurements when ordering, you can always make accommodations to the smaller size with inserts. Also include your regular USA street size shoe (in a dress shoe) for comparison.

**Example:** If your measurements are 23cm and you add  $\frac{1}{2}$  cm more then you should order a size 23.5. If you have feet that are wider then a narrow size, then add a full centimeter more to accommodate. **Example:** if you measure 23cm and your feet are wider and you add a full centimeter then you should order a size 24
